Re 2010 2243
Resequencing demonstrated that it is not a separate gene, but is a splice variant or a composite coNA. The 5' portion corresponds to a partial 2018 clone, and the 3' portion corresponds to a partial 2018 clone.
The 5' end from 1 to 911 corresponds to a partial allelic variant or 2 colle beginning a base 501 of 2018 contiuning through base pair 1019 colling for 11e 129 instead of Met 129 and 5 to A change at 307 coding for 11e 129 instead of Met 129 and 6 to A change at bp 1004 coding for 10a13 instead of Met 129 and 6 to A change at bp 1004 coding for 10a13 instead of Met 129 and 6 for 0 through base split 1612. Seconds of 2018 (beginning of exon 2) through base split 1612. Seconds of 2018 (beginning of exon 2) through base split 1612. Seconds from the previously reported 2019 sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      HUMSVP45GA 2395 bp mRNA PRI 26-JUL-1993

Pred. Mo. is the number of results predicted by chance to have a scree greater than or equal to the score of this result being printed, and is derived by analysis of the total score distribution.

| Example 2; Column 35-38; 63pp: English.  This sequence encodes a cytochrome P450 2C19 polypeptide isolated for a first manner clone in a This polypeptide is used in a method to Screen for a drug that is metabolised by a cytochrome P450 having 5-mephenyton by 4 "hydroxylase activity. The protein can also be used to identify as mitagonic, carcinogenic or cytochrotic compound. Cytochrome P450 are a large family of hamoprotein enzymes capable of metabolising xenobiotics such as steroids, fatty acids and environmental pollutants as well as endobiotics such as steroids, fatty acids and prostaglandins. Determining structure of genes whose sequence is not known from cDNA, by sequencing the gene or gene across exon intron boundaries using evenly spaced primers comprising nucleic acids that hybridize to the CDNA of gene

Example 2; Fig 3; 81pp: English.

The present invention relates to a method for determining gene sequencing when the genomic sequence is unknown. The method involves sequencing the gene across son-intron boundaries using evenly spaced pithers or tiled primers. The tiled primers comprises moteled acids that hybridise to the known this sequence of the gene at about 100-300 hase fletermined without the need to sequence the entire gene. The method expression without the need to sequence the entire gene. The method expression without the need to sequence entire chromosomal copy of the analysis. The method is also useful in germine sequence variation analysis. The method is also useful of the gene or fragment. The method are useful of the performance of the gene of fragment. The method is also useful or general the boundaries expense regions of mutleic acids that Veries separated by intervening sequence and also for determining boundaries present in genes containing group i type introns such as Tetrahymena TRNA, where self-splicing occurs

This sequence encodes the cytochrome P450 2C19 and was isolated from a human liver cDNA library. 2C19 proteins exhibit stereospecific S-CC mephenytola decivity, with a typical activity of at least I much mephenytola per mol of 2C19 per min. 2C19 is thought to be the principal human determinant of this activity. The 2C19 is contains polymorphisms at nucleotides 616 and 681 of the genomic contains polymorphisms at nucleotides 616 and 681 of the genomic contains polymorphisms at nucleotides 616 and 681 of the genomic coling sequence. These can be detected using specific PKE primers which ether amplify the wild type or the mutant aliele but not both. These mutations cause the polypeptide to lack substantial S-CC both. These mutations cause the polypeptide to lack substantial S-CC individuals which lack S-mephenytolin 4 'hydroxylase activity, however the phenotype in most complete or substantial absence of 2C19 polypeptide.

2C19 can be used to identify drugs metabolised by S-mephenytolin C 4'-hydroxylase activity which should not be administered to individuals with a deficiency in S-mephenytoln 4' hydroxylase activity.
                                                                                                                                                                                                                                                                                                                                                                                                             New isolated cytochrome P450 2C subfamily member - used for identifying drugs metabolised by 5-mephonyoin 4'-hydroxylase activity and to develop other screening assays
                                                                                                                                                                                                                                                                                                             De Morais SMF, Goldstein JA, Romkes-Sparks M;

This sequence represents the wild type human liver derived cytochrome P450 ZC19 spee. Modified versions of the encoded protein are the proteins of the human Livention. The modifications comprise a substitution of the second mino acid with Ala and a deletion of amino acid residues 3-20 of the wild type. Modified cytochrome P450 ZC19 is useful for, uninterrupted metabolism of therapeutics, e.g. omegrazole, diazepam and imipramine in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               18] amaictalgaccraigiteartcigtaittigactigaacgaatgatgatgatgcigcag 240

cytochrome P450 protein. The fusion protein can oxidise hydrocarbons or any compound having a carbon-hydrogen boad. The fusion protein can be used for hydroxylating a compound to be oxidised. It can also be used in the bioremediation of an environmental pollutant. Since the fusion protein is soluble. It can be subject to structural elucidation by X-ray expressed in soil beateria to facilitate bloremediation. The present sequence encodes mammalian sytochrome PTSD protein CFP209 from the
                                                                                                                                                                                                                                                                                                                                                              invention describes a fusion proteins comprising a portion all cytochrome P450 protein and also a portion of a mammalian

DE HUMA g ò ę ò g g & g qq ò SP O S G O.y oy oy ò Oy Oy Oy Oy g ,; ;; in the 3' and a polyademylation signal 21 bases from the poly.A tail. Clone 6b has an unsusully long 3. "noncoding region containing three possible polyademylation signals with no poly.A tail. The differences in the 3 mon-coding regions could represent alterate splicing, allelic variants, or possibly separate genes. These clones are designated as alielic variants of 2018 because they differ by only one base in the coding region. They are most similar to 209 (82% amino acid homology). agicigaailcactailgaaaactiggiaaicacigcagcigactiaciiggagciggga 900 121 tiggaaatatootacagatagtataaggatgicagcaaacoottacooaitotoca 180 116 tiggaaatacoboagtaggiatiaaggaacacagaaacoottacooaitocaa 185 126 tiggaaatooboagataggaataaggaacacagaaacoottacooaitocaa 185 | 11arity | 97.91; Score 1534.6; DB 17; Length 1852; Pred.                                                                                                                                                                                                                                         This sequence encodes a human cytochrome P450 2C9 polypeptide isolated than close close 65. This polypeptide is used in a method to screen for a drug that is metabolised by a cytochrome P450 having S-mephenytoin and alternative and activity. The protein can also be used to identify a writagefic, carcinogenic or cytochric compound. Gytochrome P450 are a large family of haemoprotein enzymes capable of metabolishing xenoblottics ench as steroids, fatty acids and prostaglandins.
                                                                                                                                                                                                Screening for drugs metabolised by cytochrome P450 - for identifying mutagenic, carcinogenic, or cytotoxic compounds
            Cytochrome P450; drug screening; S-mephenytoin 4'-hydroxylase; : identification; mutagenic; carcinogenic; cytotoxic; haemoprotein; recobiotic; environmental poliutant; ss.

```
results in one amino acid difference at position 359, lle to Leu. The clones 20c and 6b differ by one nucleotide in the coding region, position 1154, which results in a single amino acid change. Thi to Met at position 185. Clone 250 has a very long, 188 bp. 5-noncoding region and a polyadeuplation signal 21 bases from the poly. A tail. Clone 6b has an unusually long 7-noncoding region containing three possible polyadeuplation signals with no poly. A tail. The differences in the 3 non-coding regions could represent alterante splicing, allell c variants or possibly separate genes. These clones are designated as alleller variants of 2018 because they differ by only one base in the acoding region could make they differ by only one base in the acid homology).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     421 gaagcattaaggaccgtgttcaagagaaacccgttgccttgtgaagagttgagaaaaa 480

This polypeptide is used in a method to screen for a drug that is metabolised by a cytochrome P450 having S-mephenytoin P4. The protein can also be used to identify a mutagenic, carcinogenic or cytochrome also be used to identify a mutagenic, carcinogenic or cytochat compound. Cytochrome P450 are a large family of haemoprotein enzymes capable of metabolising xenobiotics enchas carcinogens and environmental pollutants as well as endoblotics such as steroids, fatty acids and prostaglandins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       211 gatatgaagtgatgaaggaagccctgattgatcttggagaggagtttctggaaagagcc 300

Novel method for the evaluation of the safety of a cpd. - using a binam cytochrome P450 and yeast MADPH reductase to determine whether the analyte cpd. is detoxified or metabolised to a carcinogen Example 1; Page 47-49; 74pp; Japanese.

This is the nucleotide sequence of the human cytochrome Pi50 molecular species 2019 gene which encodes a protein of 400 amino acids. The gene species 2019 gene which encodes a protein of 400 amino acids. The gene consists and itself from a human liver derived cDNA library as several consists amplitied from a human liver derived cDNA library as several consists and library as several consists. The prod. was cloned into the formation of the cytochrome only or into the vector pANRA to generate plasmid pacing for corprod. With the yeast ADNPH Ph50 reductase the plasmid paced under control of the yeast ADNPH Ph50 reductase. The sequence is placed under control of the yeast ADNPH produced human cytochrome Ph50 call the test cpd. With recombinantly produced human cytochrome Ph50 call their section their variants (AAT2888), 25 (AAAT2888), 22 (AAAT2888), 22 (AAAT2888), 22 (AAAT2888), 22 (AAAT2888), 22 (AAAT2888), 23 (AAAT2888), 23 (AAAT2888), 24 (AAAT2888), 24 (AAAT2888), 25 (AAAT2888), 25

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               this sequence encodes a human cytochrome P450 2C polypeptide. This by veptide is used in a method too screen for a drug that is methodised by a cytochrome P450 having S-mephenytoin 4' hydroxylase activity. The protein can also be used to identify a muteponic, carcinogenic or cytotean compound. Cytochrome P450 are a large family of haemoprotein enzymes capable of metabolising xenoblotics such as drugs carcinogens and enzionmental pollutants as well as endoblotics such as steroids, fatty acids and prostaglandins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Screening for drugs metabolised by cytochrome P450 - for identifying mutagemic, carcinogemic, or cytotoxic compounds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Cytochrome P450; drug screening; S-mephenytoin 4'-hydroxylase:
Identification: mutagenic carcinogenic; cytotoxic; haemoprotein:
xenobiotic; environmental pollutant; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 1892 BP; 481 A; 396 C; 358 G; 500 T; 157 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is a genetic construct for bacterial production of a cytochydme P450 monoxygenase. The invention relates to a method for producing plyment Wing cells containing cytochrome P450 sequences it involves the use of genetic material encoding a cytochrome P450

This sequence represents the modified version of the human liver derived vyclornom pt 950 ZL19 gene of the invention. The modifications comprise a substitution of the second amino acid with Ala and a deletion of amino acid vith Ala and a deletion of amino acid residues 3.20 of the wild type. Modified cytochrome pt.90 ZC19 is useful for, uninterrupted metabolism of therapeutics, e.g. omeprazole, diazepam and imipramine in humans.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Ouery Match 81.0%; Score 1413.6; DB 19; Length 1447; Best Local Similarity 99.0%; Pred. * NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           85.5%; Score 635.6; DB 2; Length 205791; 93.5%; Pred.
